

Pre-Lecture Quiz, Chapter 31, Lower Respiratory System Drugs

Multiple Choice

1. Which of the following may trigger an exacerbation of asthma? Select all that apply.
1. Cold weather
 2. Exercise
 3. Pet hair
 4. Sunlight

Matching

1. Match the priority of use in Column A with the drug category in Column B

1. Acute distress	A. Mast cell stabilizers
2. Long-term control	B. Short acting beta ₂ -agonists
	C. Inhaled corticosteroids
	D. Leukotriene modifiers
	E. Long-acting beta ₂ -agonists

True/False

1. Clients with asthma do not experience normal breathing patterns.
2. Salmeterol is contraindicated during acute bronchospasm.
3. Stimulation of the sympathetic nerves in the lung causes bronchoconstriction.
4. Inhaled corticosteroids can cause fungal infections; therefore, they should be used cautiously with immunosuppressed clients.

Fill in the Blank

1. Asthma is a chronic inflammatory disease that causes constriction of the _____.
2. When bronchodilators are used by clients taking antidepressants or hypertensive medications, the client should be monitored for _____tensive adverse reactions.
3. During preventative care of asthma, clients can self-monitor their lung condition using a _____ meter.

4. During acute respiratory distress, inhaled medications should be taken two to four puffs at _____ minute intervals up to three treatments.
