

Pre-Lecture Quiz, Chapter 48, Immunostimulants and Modulators

Matching

1. Match the blood cell in Column A with the activity in Column B

1. Erythrocytes	A. Line of various white blood cells
2. Leukocytes	B. Precursor cell to platelets
3. Megakaryocytes	C. Cells containing hemoglobin and carrying oxygen to tissues

True/False

1. Interferons target bacterial cell growth.
2. Flu-like symptoms are an anticipated adverse reaction to interferon administration.
3. Colony-stimulating factors are immunostimulants used in diseases such as cancer and chronic kidney disease.
4. Chronic renal failure reduces the kidney's ability to produce erythropoietin.

Fill in the Blank

1. Cytokines are a broad group of _____ involved in cell-to-cell communication.
2. Interferon beta-1b enhances T cells to reduce _____ in the nervous system of clients with multiple sclerosis.
3. Stimulation of the body to produce specific blood cells is termed _____.
4. Epoetin alfa should not be administered to clients with uncontrolled _____.
5. _____ anemia is characterized by an inadequate amount of iron in the body to produce hemoglobin.
